INVESTMENT DECK

Building Quantum Safe
Foundation for Blockchain
& Enterprises

ABOUT PQC LABS

We're a security company that helps businesses protect themselves against the next generation of computing threats.

We started by solving this problem directly for blockchain companies. Now we're building that expertise into products anyone can use.

We started with real client work, not a pitch. That's how we know what we're building actually works.

The Problem

Today's security won't survive
the next decade

The encryption protecting the
internet today has an expiration
date

Hackers are stealing encrypted
data now, to unlock it later

Almost no company knows how
exposed they are, or what to do
about it

Solution

We upgrade companies to next-generation security before it becomes a crisis, without disrupting what they've already built

01

Built on Global Standards

We only use security methods that have been officially certified and are safe for the next generation of computing. Nothing experimental, nothing unproven.

02

No Rebuild Required

Our technology plugs into a company's existing systems. They don't need to tear anything down or start over, just upgrade the security underneath.

03

Fast Migration

Most companies think this upgrade takes years of planning. We can get a company protected in weeks, not years

Products

Two focused products, built from what our clients already paid us to solve

01

Quantum-Resistant Auth Provider

Status: In Development

A secure login and identity system that companies can add to their apps. Protected against future threats from day one.

02

Quantum-Safe TLS Proxy

Status: In Plan

A tool that protects a company's existing internet traffic and data, without needing to rebuild anything. Stopping data from being stolen today and unlocked later.

Total Market Size:

**\$42 Billion
by 2030**

The combined size of the two markets our products sell into online identity and login security, and data protection infrastructure.

Market Opportunity

Target Market:

**Web3 Companies &
Regulated Businesses**

We're starting with crypto and blockchain companies, then expanding to banks, healthcare providers, and government-related businesses. Industries that must protect sensitive data for many years and are under growing pressure to upgrade.

**Growing demand
in the industry**

This market is growing nearly 50% every year. The U.S. government alone has already committed over \$7 billion to push this upgrade across its own agencies. Every serious company will eventually be forced to make this change. We're positioning ourselves to be ready first.

Business Model

We generate revenue through:

Subscription

Companies pay us monthly based on how many users log into their app, from small startups to large platforms with millions of users.

Usage-Based Pricing

For our traffic protection product, companies pay based on how much data they send through it, so cost grows naturally as they grow

Custom Enterprise Deals

Larger companies and partners can sign custom contracts for dedicated support, deeper integration, and their own branded version of our technology.

Key Milestones achieved

We started with paying clients. Every project was delivered, paid, and completed before we built a single product.

Clients:

5 Paying Clients

All blockchain and Web3 companies who hired us to build quantum-safe systems for them directly

Traction

Proof this works, before we asked anyone for funding

Revenue:

\$35,000 Generated

100% from completed, milestone-based contracts.
No funding, no product, no marketing spend

Competitive Advantage

	Built for Web3	Easy to Integrate	Proven in Production
